

IMPROVEMENT AND PRACTICAL PERFORMANCE

Classify Mistakes by Cause

Tag errors as calculation, evaluation, knowledge, time management, emotional, or process failures.

Illustrative position after ... e4 d6 Nf3 O-O

WHY THIS PRINCIPLE EXISTS

A move-level correction does not prevent recurrence. Cause-level classification reveals training targets shared by many mistakes.

THE MECHANISM

Why it works

This principle is not magic and it is not a commandment. It is a compressed prediction about skill acquisition. The useful question is: what changes in the position when the principle is followed?

DIRECT CAUSAL MECHANISM

A move-level correction does not prevent recurrence. Cause-level classification reveals training targets shared by many mistakes.

BOARD GEOMETRY

Training changes which patterns are noticed and which questions appear automatically during a game.

OPTION QUALITY

Better process produces stronger candidates more consistently, even before chess knowledge expands.

TIME AND TEMPO

Feedback, spacing, and difficulty determine whether effort becomes durable skill or temporary familiarity.

WHAT IT PREVENTS

It prevents a recurring class of errors by making a hidden cost visible before the move is played. The principle is valuable because that error pattern appears across many different openings and positions.

RECOGNITION

When to apply it

A principle becomes practical only when you can recognize its trigger. Use the signs below as evidence, then verify the exact position.

- Signal 1: Post-game review.
- Signal 2: repeated losses.
- Signal 3: the engine shows several unrelated bad moves..

FOUR-STEP APPLICATION PROTOCOL

1. Notice the trigger without choosing a move yet. 2. Generate at least two candidates, including one that follows the principle. 3. Calculate the opponent's strongest forcing reply. 4. Compare the resulting positions and apply the rule only if the concrete result supports it.

CONVERT IT INTO A BOARD QUESTION

Ask: 'Does this position give me a reason to use the following rule - Tag errors as calculation, evaluation, knowledge, time management, emotional, or process failures.' Then ask the balancing question: 'What tactical or strategic detail could make this position an exception?'

EXCEPTIONS AND CONFLICTS

Where the slogan breaks

Chess strength comes partly from knowing when two good principles conflict. The better player does not repeat the louder slogan; they rank the actual consequences.

IMPORTANT LIMITATION

Categories can overlap. Choose the earliest controllable cause rather than blaming every error on calculation.

DECISION HIERARCHY

- 1. Legal and tactical survival: checks, forced mate, and immediate material loss.
- 2. King safety and forcing initiative: whose threats arrive first?
- 3. Material and conversion: what durable gain remains when activity fades?
- 4. Piece activity, structure, space, and long-term plans.
- 5. The general principle as a tiebreaker between otherwise sound choices.

RED-FLAG TEST

Before following the rule, look for one changed defender, an exposed king, an intermediate move, a pawn break, or a tactical capture. If any exists, calculate it first. A principle explains typical positions; the board decides this position.

WORKED THINKING MODEL

How a strong player uses it

Illustrative position after ... e4 d6 Nf3 O-O

1. Read the position

Start with skill acquisition: identify the feature that will remain important after one move.

2. Find the trigger

Look for these signs: Post-game review; repeated losses; the engine shows several unrelated bad moves.

3. Produce candidates

Include one forcing move, one move guided by the principle, and one move that prevents the opponent's best idea.

4. Verify

Calculate checks, captures, and threats for the opponent. Try to refute your preferred candidate.

5. Evaluate

Use the mechanism as the explanation, not the proof: A move-level correction does not prevent recurrence. Cause-level classification reveals training targets shared by many mistakes.

Note: the board is an illustration for the thinking process, not a claim that one move is forced. Set it up and compare multiple legal candidates.

TRAINING AND RETENTION

Make it automatic

PRIMARY DRILL

Build a spreadsheet of thirty mistakes with cause, cost, trigger, and one prevention habit.

SELF-TEST

- Explain the principle without using its title.
- Name two position signals that make it relevant.
- Give one reason the principle works.
- State the exception that most often causes misuse.
- Describe the calculation check required before applying it.
-

ANSWER RUBRIC

A strong answer connects the rule - Tag errors as calculation, evaluation, knowledge, time management, emotional, or process failures. - to its mechanism, names a trigger from a real position, and explains this limitation: Categories can overlap. Choose the earliest controllable cause rather than blaming every error on calculation.

SPACED PRACTICE LOOP

Review today, then after 3, 7, 14, and 30 days. On each review, retrieve the idea before opening the PDF. Retire it only when you can recognize the trigger in a fresh position and explain an exception.
