

GAME ANALYSIS AND IMPROVEMENT

Extract One Transferable Lesson per Game

Finish analysis with one concrete question or rule you can use in a future position.

Illustrative position after ... Nf3 Nc6 Bc4 Bc5

WHY THIS PRINCIPLE EXISTS

A long list of corrections overwhelms memory. One causal lesson connected to a trigger is more likely to be retrieved over the board and can later be reinforced across many games.

THE MECHANISM

Why it works

This principle is not magic and it is not a commandment. It is a compressed prediction about the decision process that produced the move, the first important divergence, and the error pattern that can be trained. The useful question is: what changes in the position when the principle is followed?

DIRECT CAUSAL MECHANISM

A long list of corrections overwhelms memory. One causal lesson connected to a trigger is more likely to be retrieved over the board and can later be reinforced across many games.

BOARD GEOMETRY

A post-game position is evidence. Reconstructing candidates and threats shows what the player actually noticed or overlooked.

OPTION QUALITY

Analysis improves future choice only when it compares real candidates and turns the discovered cause into a repeatable question.

TIME AND TEMPO

Clock use is part of the position. Review whether time was spent on genuinely critical decisions or consumed by low-value uncertainty.

WHAT IT PREVENTS

It prevents a recurring class of errors by making a hidden cost visible before the move is played. The principle is valuable because that error pattern appears across many different openings and positions.

RECOGNITION

When to apply it

A principle becomes practical only when you can recognize its trigger. Use the signs below as evidence, then verify the exact position.

- Signal 1: a game has just finished.
- Signal 2: your evaluation changed sharply.
- Signal 3: you spent unusual time.
- Signal 4: you missed a candidate or repeated a familiar error.

FOUR-STEP APPLICATION PROTOCOL

1. Notice the trigger without choosing a move yet. 2. Generate at least two candidates, including one that follows the principle. 3. Calculate the opponent's strongest forcing reply. 4. Compare the resulting positions and apply the rule only if the concrete result supports it.

CONVERT IT INTO A BOARD QUESTION

Ask: 'Does this position give me a reason to use the following rule - Finish analysis with one concrete question or rule you can use in a future position.' Then ask the balancing question: 'What tactical or strategic detail could make this position an exception?'

EXCEPTIONS AND CONFLICTS

Where the slogan breaks

Chess strength comes partly from knowing when two good principles conflict. The better player does not repeat the louder slogan; they rank the actual consequences.

IMPORTANT LIMITATION

Engine evaluations without reconstructing your own thinking can hide the cause of the error. Analyze unaided first and distinguish a bad process from a hard but reasonable decision.

DECISION HIERARCHY

- 1. Legal and tactical survival: checks, forced mate, and immediate material loss.
- 2. King safety and forcing initiative: whose threats arrive first?
- 3. Material and conversion: what durable gain remains when activity fades?
- 4. Piece activity, structure, space, and long-term plans.
- 5. The general principle as a tiebreaker between otherwise sound choices.

RED-FLAG TEST

Before following the rule, look for one changed defender, an exposed king, an intermediate move, a pawn break, or a tactical capture. If any exists, calculate it first. A principle explains typical positions; the board decides this position.

WORKED THINKING MODEL

How a strong player uses it

Illustrative position after ... Nf3 Nc6 Bc4 Bc5

1. Read the position

Start with the decision process that produced the move, the first important divergence, and the error pattern that can be trained: identify the feature that will remain important after one move.

2. Find the trigger

Look for these signs: a game has just finished; your evaluation changed sharply; you spent unusual time; you missed a candidate or repeated a familiar error

3. Produce candidates

Include one forcing move, one move guided by the principle, and one move that prevents the opponent's best idea.

4. Verify

Calculate checks, captures, and threats for the opponent. Try to refute your preferred candidate.

5. Evaluate

Use the mechanism as the explanation, not the proof: A long list of corrections overwhelms memory. One causal lesson connected to a trigger is more likely to be retrieved over the board and can later be reinforced across many games.

Note: the board is an illustration for the thinking process, not a claim that one move is forced. Set it up and compare multiple legal candidates.

TRAINING AND RETENTION

Make it automatic

PRIMARY DRILL

Collect twelve positions connected to 'Extract One Transferable Lesson per Game'. For each, write three candidates, the opponent's strongest reply, and a one-sentence evaluation. Revisit the same positions without notes after three and seven days; score recognition separately from calculation accuracy.

SELF-TEST

- Explain the principle without using its title.
- Name two position signals that make it relevant.
- Give one reason the principle works.
- State the exception that most often causes misuse.
- Describe the calculation check required before applying it.
-

ANSWER RUBRIC

A strong answer connects the rule - Finish analysis with one concrete question or rule you can use in a future position. - to its mechanism, names a trigger from a real position, and explains this limitation: Engine evaluations without reconstructing your own thinking can hide the cause of the error. Analyze unaided first and distinguish a bad process from a hard but reasonable decision.

SPACED PRACTICE LOOP

Review today, then after 3, 7, 14, and 30 days. On each review, retrieve the idea before opening the PDF. Retire it only when you can recognize the trigger in a fresh position and explain an exception.
